# FHI-aims capabilities
for molecules, clusters, and solids

Main developers

**Volker Blum
Duke University, US**

**Matthias Scheffler
Humboldt University and
Fritz Haber Institute of the
Max Planck Society,
Germany**

FHI-aims

Main focus:

• **Accurate all-electron electronic-structure calculations (DFT and beyond) for both periodic and cluster/molecular systems**

• **Massively parallel**

Robust interface: atomic simulation environment (ASE)

Approximations to the electronic problem: Basis set

Idea: represent all unknown functions ($\rho(\mathbf{r}), \psi_i(\mathbf{r})$)
as a linear combination of known functions with well-defined
properties: $\psi_i(\mathbf{r}) = \sum_p C_{ip}\varphi_p(\mathbf{r})$

Widely used basis sets:

gaussians $x^i y^j z^k \exp(-\alpha r^2)$ **(localized, analytic integrals)**

plane waves $\exp(i\mathbf{k}\cdot\mathbf{r})$ **(delocalized, analytic integrals)**

Slater-type $x^i y^j z^k \exp(-\alpha r)$ **(localized, nuclear cusp)**

grid-based $\delta(\mathbf{r} - \mathbf{r}_i)$ **(localized, analytic integrals)**

Core electrons are often treated separately (pseudopotentials, plane-wave + localized basis)
The basis set: Numeric atomic orbitals

$$\varphi_{i[lm]}(\boldsymbol{r}) = \frac{u_i(r)}{r} \cdot Y_{lm}(\Omega)$$

Many popular implementations: DMol³ (Delley), FPLO (Eschrig et al.), PLATO (Horsfield et al.), PAOs (Siesta, Conquest, OpenMX², Fireball, ...)

- $u_i(r)$: Flexible choice - "Anything you like."

$$\left[-\frac{1}{2}\frac{d^2}{dr^2} + \frac{l(l+1)}{r^2} + v_i(r) + v_{\text{cut}}(r) \right] u_i(r) = \epsilon_i u_i(r)$$

- free-atom like: $v_i(r) = v_{\text{free atom}}^{\text{DFT}}(r)$
- Hydrogen-like: $v_i(r) = z/r$
- free ions, harm. osc. (Gaussians), ...
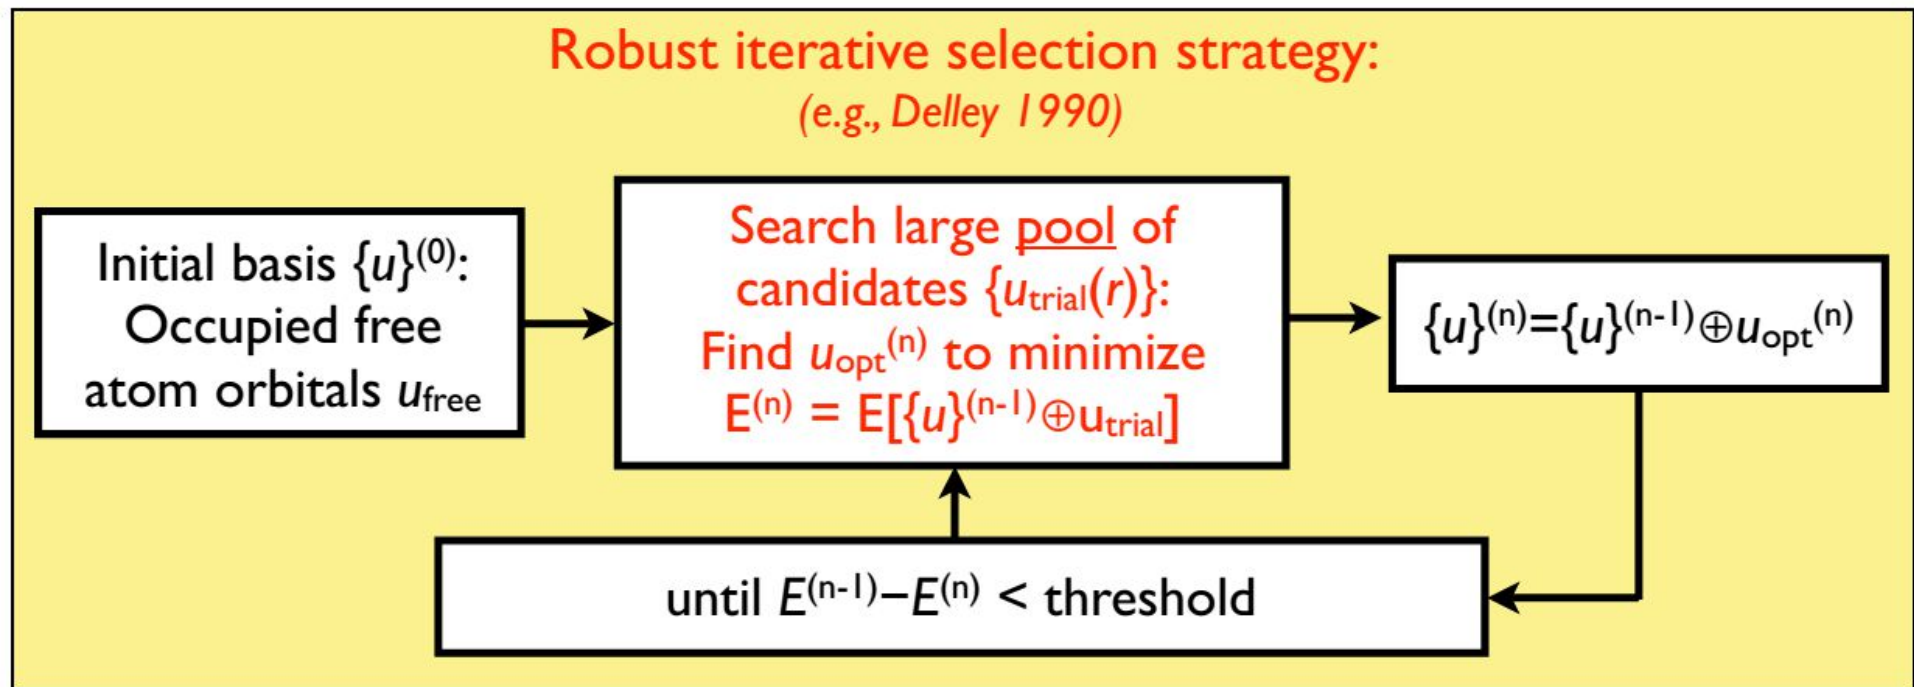

The basis set: Numeric atomic orbitals

$$\varphi_{i[lm]}(\boldsymbol{r}) = \frac{u_i(r)}{r} \cdot Y_{lm}(\Omega)$$

- $u_i(r)$: Flexible choice - "Anything you like."

→ Localized; "naturally" all-electron

→ The choice of <u>efficient</u> and of <u>enough</u> radial functions is obviously important

→ We have a basis set library for all elements (1-102), from fast qualitative to meV-converged (total energy, LDA/GGA) calculations - <u>efficient and accurate approach</u>

V. Blum, R. Gehrke, F. Hanke, P. Havu, V. Havu, X. Ren, K. Reuter and M. Scheffler, "Ab Initio Molecular Simulations with Numeric Atom-Centered Orbitals", Computer Physics Communications **180**, 2175-2196 (2009)

The basis set

Robust iterative selection strategy:
(e.g., Delley 1990)

Initial basis $\{u\}^{(0)}$:
Occupied free
atom orbitals u_{free}

Search large pool of
candidates $\{u_{trial}(r)\}$:
Find $u_{opt}^{(n)}$ to minimize
$E^{(n)} = E[\{u\}^{(n-1)} \oplus u_{trial}]$

$\{u\}^{(n)} = \{u\}^{(n-1)} \oplus u_{opt}^{(n)}$

until $E^{(n-1)} - E^{(n)} <$ threshold

The basis set

Pick basis functions one by one, up to complete *total energy* convergence

Systematic buildup of basis set for:
H_2
O_2
Au_2

$(\sum \varepsilon_i) - (\sum \varepsilon_i)_{converged}$ [meV]

Basis size

Remaining basis set error
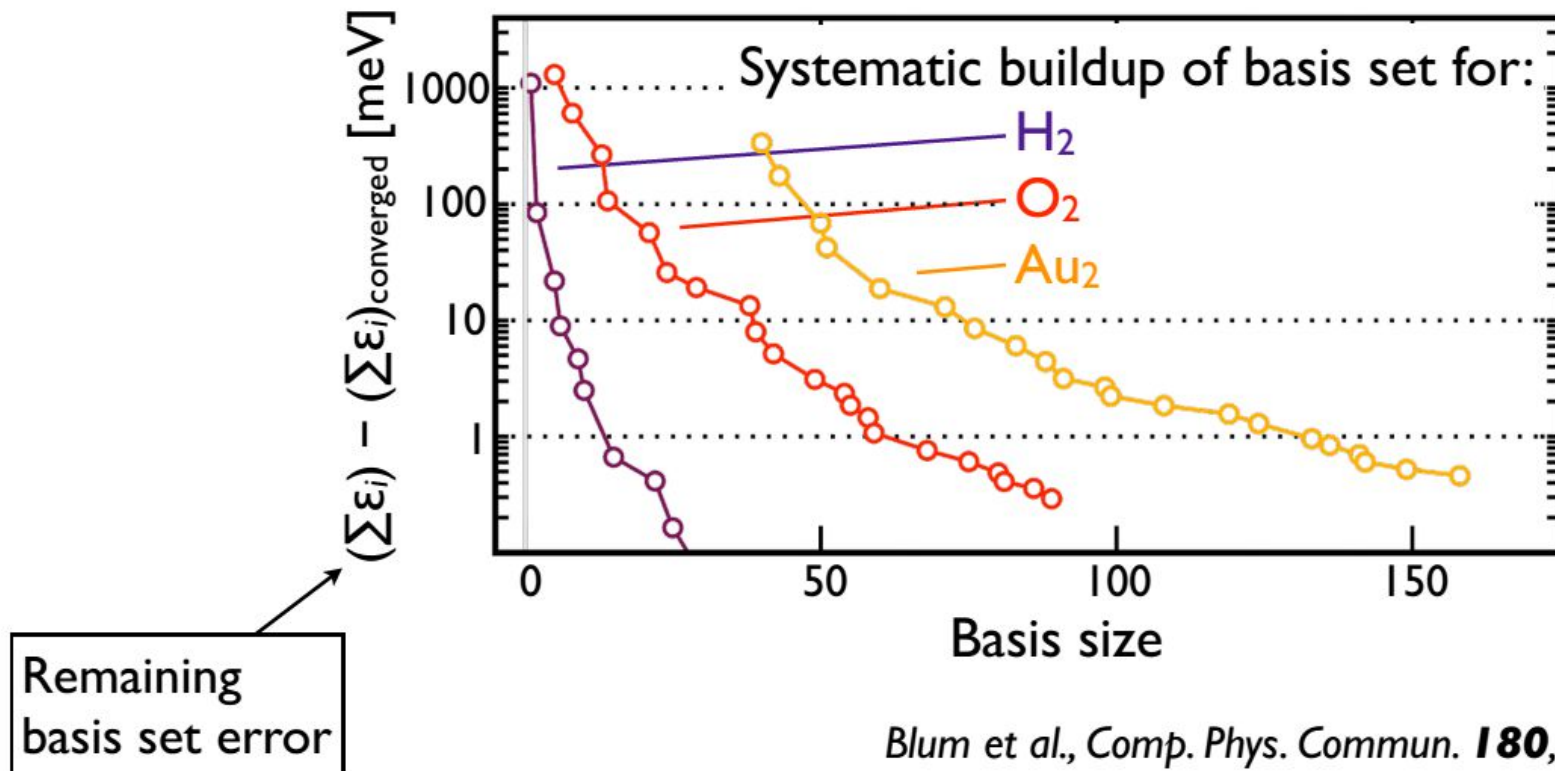

Blum et al., Comp. Phys. Commun. **180**, *2175-2196 (2009)*

The basis set

	H	C	O	Au
minimal	$1s$	[He]+$2s2p$	[He]+$2s2p$	[Xe]+$6s5d4f$
Tier 1	H($2s$,2.1)	H($2p$,1.7)	H($2p$,1.8)	Au^{2+}($6p$)
	H($2p$,3.5)	H($3d$,6.0)	H($3d$,7.6)	H($4f$,7.4)
		H($2s$,4.9)	H($3s$,6.4)	Au^{2+}($6s$)
				H($5g$,10)
				H($6h$,12.8)
				H($3d$,2.5)
Tier 2	H($1s$,0.85)	H($4f$,9.8)	H($4f$,11.6)	H($5f$,14.8)
	H($2p$,3.7)	H($3p$,5.2)	H($3p$,6.2)	H($4d$,3.9)
	H($2s$,1.2)	H($3s$,4.3)	H($3d$,5.6)	H($3p$,3.3)
	H($3d$,7.0)	H($5g$,14.4)	H($5g$,17.6)	H($1s$,0.45)
		H($3d$,6.2)	H($1s$,0.75)	H($5g$,16.4)
				H($6h$,13.6)
Tier 3	H($4f$,11.2)	H($2p$,5.6)	O^{2+}($2p$)	H($4f$,5.2)*
	H($3p$,4.8)	H($2s$,1.4)	H($4f$,10.8)	H($4d$,5.0)
	...	...	...	...

Systematic hierarchy of basis (sub)sets, iterative *automated* construction based on *dimers*

"First *tier* (level)"

"Second *tier*"

"Third *tier*"
...

The basis set

Basis set limit (independent):
$E_{Hb} = -219.8$ meV

Basis sets: Radial fn. character

	H	C,N,O
minimal	1s	[He]+2s2p
tier 1	s,p	s,p,d
tier 2	s,p,s,d	s,p,d,f,g
tier 3	s,p,d,f	s,p,d,f

The basis set: additional parameters to converge

$$h_{ij} = \int d^3r\, \varphi_i(\boldsymbol{r})\, \hat{h}_{\text{KS}}\, \varphi_j(\boldsymbol{r})$$

- *Discretize* to integration grid:
$$\int d^3r\, f(\boldsymbol{r}) \rightarrow \sum_{\boldsymbol{r}} w(\boldsymbol{r})\, f(\boldsymbol{r})$$

... but even-spaced integration grids are *out*:
$f(r)$ strongly peaked near all nuclei!

- Overlapping atom-centered integration grids:

  - Radial *shells (e.g., H, light: 24; Au, tight: 147)*

  - *Specific* angular point distribution ("Lebedev")
  exact up to given integration order l
  (50, 110, 194, 302, ... points per shell)
Pioneered by
Becke JCP 88, 2547 (1988), Delley, JCP 92, 508 (1990), MANY others!

Electronic structure methods

Quantum chemistry & many-body theory:

$$\hat{\mathcal{H}}\Psi = E\Psi$$

... successive refinement of Ψ

Density functional theory: *(Hohenberg-Kohn 1964, Kohn-Sham 1965)*

$$E_{tot} = E[n(r)] = T_s[n] + V[n] + V_{es}[n] + E_{xc}[n]$$

"Perdew's ladder" to exact solution
- Key practical approximation: E_{xc}

response / many-body terms: RPA, SOSEX, ...

hybrid functionals: non-local exchange

meta-GGAs: $\nabla^2 n(r)$, $\nabla^2 \varphi(r)$

Generalized gradient approximations (GGAs): $|\nabla n(r)|$

Local-density approximation (LDA): $n(r)$

cost, accuracy

Part I: atom and molecule

Problem I: Hydrogen atom

Tasks:

- Input files needed to run FHI-aims.

- Test the convergence of the total energy with basis size.

- Compare the total energy of the hydrogen atom computed with different methods implemented in FHI-aims. Do all methods converge to the same result?

FHI-aims input files

Postprocessing

Structure optimization
- » Get next relaxation step
- » Redo SCF for new geometry

8   `Have a nice day.`

Problem II-III: H_2

Tasks:

- Learn how to optimize geometry with FHI-aims.
- Calculate relative energies of different spin states.
- Calculate the atomization energy (ΔH_{at}).
- See how geometry and atomization energy depend on the exchange-correlation functional.

Problem II-III: H_2

From now on, run FHI-aims via the batch system:

1) copy the file job.sh from the tutorial folder to your working directory

2) submit a job:
sbatch --ntasks=XX job.sh

3) To see the progress, type
tail   -f   output

Part II: periodic system

surface
bulk

atom            2.0   2.0   0.0 Si
```

fcc

fcc(111)

Important practical points

- Each calculation one directory, for example

```
> mkdir tutorial1
> cd tutorial1
> mkdir O2
```

- 2 input files (plus 1 for pseudopotential embedding)

```
geometry.in
control.in
```

- Launching FHI-aims calculation

sbatch --ntasks=XX job.sh

Visualization

Orbitals and densities

Keyword in `control.in`

```
output cube eigenstate homo
cube filename HOMO.cube
output cube total_density
cube filename tot_dens_uc.cube
```
Get: ***.cube file** - values on a regular 3D grid.

Software: jmol

$\Rightarrow$ Appendix of handout
Lab 2: Calculate phase diagram of γ-Al$_2$O$_3$ (110) surface in NO atmosphere

Lab 2: Calculate phase diagram of γ-Al$_2$O$_3$ (110) surface in NO atmosphere

Both team and individual work

1) Relax NO molecule (team)
2) Construct surface slab model from bulk (team)
3) Place NO at the surface in three different configurations and *different* coverages for each student (overall 28 structures) (team)
4) Distribute the structures among students evenly (7 each) (team)
5) Test convergence of NO adsorption energy as a function of the number of relaxed bottom layers for one structure (individual)
6) Choose the optimal number of relaxed layers (team)
7) Relax the structures, report the energy, discuss the difference between starting and final geometries, calculate, report, and discuss work function (individual)
8) Build a surface phase diagram in NO atmosphere combining all obtained energies (team)

Use "light" settings and 2x2x1 k-points for all calculations
